Hey Gene,

Some of the line items are higher and others lower than what we've seen for other projects but in general I would agree this comes in around or below the top end of what we would budget ~80K. The bid does not follow the bid form and I noticed it does not include a step rate pumping test, but I think we could iron that out with them in a meeting to vet qualifications and approach.

Doing some quick googling it looks like the proposal is from a couple of folks that transitioned from Layne when they shuttered the Guthrie offices. None of our team have had project experience with them so I think it would be good to have a quick call with the DC folks to confirm if they plan to use their own rig, subcontract, etc and to make sure they are on the same page about approach/scope schedule and contract terms. If that meeting goes good we could proceed and save the hassle and costs of re-formatting the bid to incorporate the municipal well.

Do you want us to reach out to them to set up a call?

We've received the attached proposal from DC Wells. It looks to be inline with what was spec'd and budgeted.

Any thoughts?

Hey Gene,

We've been reaching out to the well drilling contractors on the list. The consensus from multiple drillers is that they are busy with current backlog and that a mobilization of a test rig unless it is already in the area would be time/cost prohibitive. I double checked, and they did not have any issue with the specifications, just simply a busy drilling market right now.

They all expressed interest in bidding if the municipal well was potentially in the same contract. Not sure that is the correct move without exploring some other alternatives first. We have a couple of other calls to make to drillers in north Texas and around Oklahoma to see if we can find an interested company.

We'll keep working the issue with a few other drilling companies and let you know what we find out.
